Auto Ticket Classification using FLOW DESIGNER

1. Brainstorming & Ideation Phase

Introduction

IT departments frequently receive a high volume of service requests. Manually classifying tickets is time-consuming and can lead to delays and inconsistencies. This project aims to automate the classification process using ServiceNow Flow Designer.

Content

The core idea is to create an automated workflow that analyzes incoming tickets and classifies them into appropriate categories based on predefined rules. Flow Designer will streamline this process to improve accuracy and reduce manual effort.

Key Points

- Create a structured logical decision tree.
- Define categories based on ticket keywords.
- Automate assignment of tickets.
- Implement flow logic for accurate and efficient classification.
- Notify relevant teams upon assignment.
- Reduce manual work and processing time.

Conclusion

The brainstorming phase helped identify the need for automating ticket classification. The proposed idea focuses on leveraging ServiceNow Flow Designer to create a reliable and efficient process that improves response time and reduces manual workload.
