Auto Ticket Classification using FLOW DESIGNER

2. Requirement Analysis Phase

Introduction

The requirement analysis phase identifies what the organization needs from the auto ticket classification process.

Content

The system should:

1. Provide a standard ticket classification form.
2. Capture ticket details and user information.
3. Submit the request through the Service Catalog.
4. Trigger an approval process when required.
5. Automatically create fulfillment tasks.
6. Send notifications to relevant users.
7. Track the status of the request.

Key Points

- The process should be easy to use.
- Automation should reduce processing time.
- Requests should be traceable.
- The workflow should be reliable and consistent.
- Only authorized users should perform approval or fulfillment activities.

Conclusion

The requirement analysis phase clearly defines the functional and non-functional requirements of the project. These requirements provide a strong foundation for developing a reliable, traceable, and user-friendly automated ticket classification workflow.
